

ABSTRACT OF THE DISCLOSURE

A method and computer program product for reducing colormap flashing on a display system where the display system has a single hardware colormap. The method includes the steps of intercepting a request from an application program for an allocation of a private colormap, and transparently
5 simulating the allocation of the private colormap using the default colormap. In this manner, colormap flashing is reduced as the default colormap is used to satisfy private colormap requests.
